

ABSTRACT OF THE DISCLOSURE

In the piezoelectric transformer for fluorescent lamp, the size of an electrode at the central region of each sides on the first face is smaller than that of electrode at the corner region. As a result, the stress generated in the piezoelectric block is minimized and the heat caused by the stress is prevented, so that the damage of the piezoelectric block and the deterioration of the efficient may be prevented. The input electrode can be formed in the various shapes such as diamond, cross, and rhombic shapes.
